

ENCAPSULATION:

wrapping up the implementation of data members and stuff in a class. To protect them from outside world.

ABSTRACTION:

Hiding unnecessary details & showing only necessary information.

→ Example: complex implementation of something is hidden and only results are shown.

→ Basically it is data hiding.

→ Abstraction is design level encapsulation is an implementation level.

So encapsulation is process of hiding and making that data inaccessible while abstraction is hiding all the process complex implementation and just showing the result.
